Abstract

Replace this text with a self-contained summary of your research problem, approach, main findings, and implications. State the problem and its importance, describe the proposed method, summarize the evidence, and explain the principal contribution. This file is an editable paper scaffold; all example content, author details, and conference metadata must be replaced before submission.

Keywords

keyword one, keyword two, keyword three

ACM Reference Format:
First Author and Second Author. 2026. Your Paper Title: A Descriptive Subtitle. In *Conference Name (CONF '26), Month DD–DD, 2026, City, Country.* ACM, New York, NY, USA, 2 pages.

1 Introduction

Introduce the research problem, explain why it matters, and identify the gap addressed by this paper. Define the intended scope and explain the practical or theoretical setting. Keep the claims specific enough to be supported by the evaluation.

Summarize your approach and list the main contributions:

- A clearly stated research question or problem formulation.
- A method, system, or analysis that addresses the identified gap.
- An evaluation that supports the paper's principal claims.

The remaining sections provide a starting structure for a conference paper. Replace the instructional prose with your own research.

2 Related Work

Organize prior research by theme and explain how your contribution relates to each theme. Use citations to support specific statements. For example, Lamport [1] provides a reference for document preparation in LaTeX. This citation demonstrates the ACM bibliography style; it is not intended as evidence for your research topic.

3 Method

3.1 Problem Formulation

Define the inputs, outputs, assumptions, and notation. For example, a training objective may be written as

$$\mathcal{L}(\theta) = \frac{1}{N} \sum_{i=1}^{N} \ell(f_\theta(x_i), y_i), \tag{1}$$

where N is the number of examples and θ denotes model parameters. Replace Equation 1 with an expression appropriate to your work.

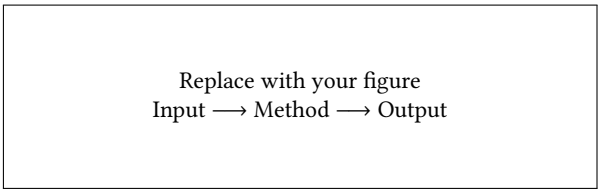

Figure 1: A placeholder for a single-column overview figure. Replace the box with `\includegraphics[width=\linewidth]{images/figure.pdf}`.

Table 1: Example results structure. Replace all placeholder entries.

Method	Metric A	Metric B
Baseline	—	—
Proposed method	—	—

3.2 Proposed Approach

Describe the core idea and the steps needed to reproduce it. Explain design choices and provide sufficient detail about implementation or analysis.

Figure 1 illustrates the approach. Give every figure a useful caption and an accessibility description.

4 Evaluation

4.1 Experimental Setup

Specify datasets, baselines, metrics, hardware, and relevant parameter choices. Describe the procedure and any statistical analysis. Explain how results can be reproduced.

4.2 Results

Report observations supported by the collected evidence. Table 1 provides a formatting example. Its entries are placeholders, not experimental findings.

5 Discussion and Limitations

Interpret the results in relation to the research question. Discuss assumptions, threats to validity, failure cases, and the limits of generalization. Include ethical considerations where relevant.

6 Conclusion

Summarize the contribution and the evidence that supports it. State the main implication and identify a concrete direction for future work.

Acknowledgments

Replace this text with funding and acknowledgments, or remove this environment. Omit identifying acknowledgments when preparing an anonymous submission.
